EXECUTIVE SUMMARY

As Amazon businesses scale, small demand shifts quickly turn into large operational and financial consequences, making predictability harder to sustain—even with strong planning and controls.

Infinite Commerce is a large-scale Amazon operator, now merged with Razor Group, running a \$400M+ business across more than 18,000 SKUs. Despite strong internal controls and disciplined planning across inventory, pricing, finance, and forecasting, the core challenge was not growth—it was predictability.

Amazon marketplace conditions change daily, and even small demand shifts at this scale created outsized downstream effects. Products sold faster or slower than planned, inventory drifted out of balance, and teams were pushed into reactive decisions to protect availability and cash flow. Over time, forecasts became harder to trust, working capital was trapped in inventory, and execution increasingly relied on manual intervention that could not keep pace with the market.

Razor Group partnered with Trellis Dynamic Pricing and used pricing as a continuous control system to absorb volatility rather than forecast it away. By dynamically rebalancing demand across the catalog, the business was able to stabilize operations and bring realized sales closer to plan with controlled discounting.

The impact was material. Forecast accuracy improved meaningfully, discounting became more efficient, and operations stabilized. On discount efficiency alone, Razor Group achieved an estimated **18x return on investment**, while restoring predictability across inventory, cash flow, and operations.

BACKGROUND

Amazon marketplaces evolve faster than operating plans can adapt. Demand shifts unevenly, inventory falls out of sync, and teams are forced into reactive decisions to protect cash flow and availability. Over time, this creates operational noise—emergency adjustments, reactive discounting, and plans that fail to hold.

Infinite Commerce—now merged with Razor Group—faced this challenge at scale. Running a \$400M+ Amazon business with over 18,000 SKUs, the team struggled to maintain predictable sell-through as daily marketplace changes amplified small demand shifts into outsized downstream effects, despite strong internal controls.

THE MARKETPLACE IS A DYNAMIC SET OF METRICS THAT ARE IMPOSSIBLE TO MEASURE ALL THE TIME ACROSS THOUSANDS OF PRODUCTS.

~ JASON BAER CMO RAZOR GROUP

When demand moved faster than forecasts, inventory plans drifted. High-velocity products stocked out, slower products accumulated excess inventory, and teams were pushed into reactive adjustments across inventory, finance, and marketing. Forecasts became unreliable—not due to poor modeling, but because the market itself was too dynamic.

Razor Group partnered with Trellis to solve a shared Amazon-seller problem: **how to operate predictably when demand is inherently volatile. The challenge was not forecasting, but sustaining execution as conditions changed.**

GUIDING PRINCIPLE

Predictability cannot be forecasted into existence. Forecasts describe an expected future, but they do not keep execution aligned when markets shift faster than planning cycles.

Razor Group believed pricing could act as a control mechanism—using margin from overperforming products to selectively discount underperforming ones, allowing the business to sell at its expected rate with minimal discounting. Because demand is uneven across a catalog, static pricing causes slow movers to accumulate inventory while fast movers stock out.

Trellis treated pricing not as a revenue maximization lever, but as an operating system—absorbing volatility at the market boundary before it propagated into inventory, operations, and financial planning. The goal was controlled demand shaping: **hitting expected sales rates, maintaining inventory balance, and operating predictably with modest discounting.**

THE APPROACH

WE KNOW WHAT WE HAVE TO SELL AND WHAT OUR COSTS ARE. WHAT WE NEEDED WAS A WAY TO UNDERSTAND CHANGING MARKETPLACE CONDITIONS TO FIND THE RIGHT PRICE AT THE VOLUME WE EXPECTED.

~ JASON BAER CMO RAZOR GROUP

Trellis Dynamic Pricing implemented pricing as a continuous adjustment layer between marketplace volatility and inventory plans. Prices updated daily based on live signals—demand elasticity, competitor pricing, sales trends, advertising behavior, and inventory position—allowing deviations from plan to be corrected as they emerged.

Rather than aggressive discounting, pricing was used to rebalance uneven demand: **gaining margin on overperforming SKUs while selectively discounting lagging ones.** In doing so, Trellis revealed that many overperforming products were underpriced relative to market demand, allowing prices to be raised without sacrificing sales velocity and creating incremental margin headroom that offset discounts elsewhere.

Stabilizing Demand Through Pricing

Adjusting prices helped products sell more evenly, reduced excess inventory, and freed up cash.

Where Margin Was Given and Taken

Weekly Sales Moved Closer to Plan

At Razor Group, discounting was intentionally capped near 5%. Previously, price changes were handled manually—a tedious and error-prone process that could not react quickly to changing marketplace conditions. Automation replaced these manual workflows, enabling thousands of SKUs to respond systematically and eliminating lag and operational noise.

THE IMPACT

The use of continuous pricing intervention with Trellis Dynamic Pricing stabilized execution and improved predictability. Forecast accuracy improved materially, with wMAPE (Weighted forecast error) declining from **~48% to ~36%**, and forecasts became usable operational inputs rather than directional estimates.

Inventory performance improved as demand became easier to manage. Pricing allowed the business to recover sales velocity on underperforming products while enhancing margin on overperforming ones, reducing the need for broad or reactive discounting. Compared to manual pricing, Trellis achieved better adherence to forecast with approximately **4.5% less discount**, allocating pricing pressure more efficiently across the catalog. On discount efficiency alone, this delivered an estimated **18x return on investment**, excluding any operational or planning benefits.

Execution became calmer and more reliable:

- More predictable cashflow
- Steadier sell-through
- Eliminating the constant manual intervention.

Trellis Dynamic Pricing created a more predictable operating environment where:

- Sales targets could be met
- Inventory aligned significantly closer to plan
- Volatility was absorbed with controlled, minimal discounting.

TRELLIS TAKES OUT THE GUESSWORK OF WHAT THE NECESSARY PRICE NEEDS TO BE TO SELL THE UNITS YOU ARE EXPECTING TO SELL. THE MARKETPLACE IS A DYNAMIC SET OF METRICS THAT ARE IMPOSSIBLE TO MEASURE ACROSS THOUSANDS OF PRODUCTS — WITHOUT TRELLIS, WE'D BE STUCK AT A STATIC PRICE OR WITH VERY LABOR-INTENSIVE MANUAL INTERVENTION.
